**Date of Performance: 30/07/2025**

**Date of Submission: 30/07/2025**

### Experiment No. 3

**Aim: To study installation and configuration of Linux Kernel firewall iptables.**

#### Code Screen Shots:

To list the current rules that are configured for iptables:

```
apsit@apsit-HP-280-Pro-G6-Microtower-PC:~$ sudo iptables -L
[sudo] password for apsit:
Chain INPUT (policy ACCEPT)
target     prot opt source                destination

Chain FORWARD (policy DROP)
target     prot opt source                destination
DOCKER-USER all -- anywhere             anywhere
DOCKER-ISOLATION-STAGE-1 all -- anywhere             anywhere
ACCEPT     all -- anywhere             anywhere             ctstate RELATED,ESTABLISHED
DOCKER     all -- anywhere             anywhere
ACCEPT     all -- anywhere             anywhere
ACCEPT     all -- anywhere             anywhere

Chain OUTPUT (policy ACCEPT)
target     prot opt source                destination

Chain DOCKER (1 references)
target     prot opt source                destination

Chain DOCKER-ISOLATION-STAGE-1 (1 references)
target     prot opt source                destination
DOCKER-ISOLATION-STAGE-2 all -- anywhere             anywhere
RETURN     all -- anywhere             anywhere

Chain DOCKER-ISOLATION-STAGE-2 (1 references)
target     prot opt source                destination
DROP       all -- anywhere             anywhere
RETURN     all -- anywhere             anywhere

Chain DOCKER-USER (1 references)
target     prot opt source                destination
RETURN     all -- anywhere             anywhere
```

PARSHVANATH CHARITABLE TRUST'S

This iptables command adds a rule to reject outgoing TCP traffic from IP 192.168.86.30 to destination port 873 (typically used by rsync) if the connection is already ESTABLISHED. It uses conntrack module to match existing connections and applies the REJECT action instead of just dropping the packet.

```
apsit@apsit-HP-280-Pro-G6-Microtower-PC:~$ sudo iptables -A OUTPUT -p tcp -s 192.168.86.30 --dport 873 -m conntrack --ctstate ESTABLISHED -j REJECT
apsit@apsit-HP-280-Pro-G6-Microtower-PC:~$ sudo iptables -L
Chain INPUT (policy ACCEPT)

These iptables rules allow incoming and outgoing HTTP (port 80) and HTTPS (port 443) traffic only if the connection is already established, ensuring secure web communication continuity.

It uses multiport to specify multiple destination ports and conntrack to match connections in the ESTABLISHED state.

```

This iptables rule allows outgoing MySQL traffic (port 3306) if the connection is already ESTABLISHED, ensuring database response packets are allowed. It uses --sport and --dport to filter traffic on MySQL port and tracks connections using conntrack.

```
Activities  Terminal  Wed 11:10 AM
